

Depending on what MacOS you upgraded from, you may or may not need to do any extra steps, like the following:

1. After MacOS upgrade, go to System Settings -> General -> Login Items & Extensions -> Allow in the Background --- ColorProof Software should have the trigger in ON position.
2. If ColorProof Software is not listed in System Settings -> General -> Login Items & Extensions -> Allow in the Background, launch ImagePrint, select Help->Chek_for_Updates and click on Download and Run Installer in order to restore xinetd and get the ColorProof Software record in place.
